MockMate – Project Solution Pitch

The Great Indian Internship Challenge

Problem

Preparing for interviews is not only about reading questions. Candidates also need practice speaking clearly, explaining their thinking, and handling follow-up questions. Static question lists do not provide the same experience as a real conversation.

Proposed Solution

MockMate is an AI-based mock interview platform where candidates can practise through a voice conversation. A candidate can provide interview context, such as the role they are preparing for, and then answer questions asked by an AI interviewer named Aria. The platform uses the candidate's responses to continue the conversation with relevant follow-up questions.

How It Works

1. The candidate sets up an interview using their role and available resume information.
2. Aria asks an interview question and reads it aloud.
3. The candidate records an answer using the microphone and stops the recording when finished.
4. The recorded answer is converted into text, which is sent to the AI conversation flow.
5. The AI generates the next question based on the conversation.

Gnani Integration

MockMate uses Gnani's Prisma V3.0 Speech-to-Text model to transcribe the candidate's recorded answer. It uses Gnani's Timbre V2.5 Text-to-Speech model to convert Aria's questions into spoken audio. These integrations make the interview experience voice-based instead of relying only on typed responses.

Main Features

• Interview setup based on the candidate's role and resume context.
• Voice-based interaction with an AI interviewer.
• Speech-to-text transcription of candidate answers.
• Text-to-speech playback of AI questions.
• Follow-up questions generated from the ongoing conversation.

Technology Used

Next.js, React, TypeScript, Tailwind CSS, Groq API, Gnani Prisma V3.0, Gnani Timbre V2.5, and the browser MediaRecorder API.
